Installation Report

Shift Espresso Silvamonte
First Live Client Installation

Date: June 2026

Prepared for: Dunni Karp & Meir (FlowDesk Partners)

Client: Daniel (Shop Owner)

Location: Silvercrest Shopping Centre, 11 Swemmer Road, Silvamonte, Johannesburg

CONFIDENTIAL - For internal use only

1. Executive Summary

FlowDesk was installed for Shift Espresso Silvamonte, a coffee shop at Silvercrest Shopping Centre, 11 Swemmer Road, Silvamonte, Johannesburg. This was the first live client installation of FlowDesk.

The installation covered WhatsApp Business API integration, AI-powered customer chat, menu ordering, loyalty programme, keyword automations, and admin workspace setup. The client (Daniel) is the shop owner. The system went live on June 10, 2026.

2. What Was Set Up

- **WhatsApp Business API:** Connected Daniel's new business number (+27 60 977 8723) via Meta Business Suite. System User token generated, webhook configured, phone number registered and verified.
- **FlowDesk Workspace:** "Shift Espresso Silvamonte" (Workspace ID 23) created with Daniel as owner. Admin access for Meir and team.
- **AI Assistant:** Claude Haiku-powered conversational bot. Business name, FAQs, menu, hours, address, Wi-Fi, pet-friendly info loaded. System prompt with 26 safety/behavior rules.
- **Keyword Automations:** 7 automations created: Welcome Menu, Our Menu, Opening Hours, Location, Order, Loyalty, Speak to Someone. Static formatted responses for common queries.
- **Coffee Menu:** Full hot coffee menu (18 items), cold coffee menu (7 items), extras (oat milk, almond milk, decaf, extra shot). All single-size pricing.
- **Order System:** WhatsApp ordering for coffee only. AI-powered order parsing, confirmation flow (YES/NO), pickup options (counter or curbside), customer notes (extra hot, no sugar, etc.).
- **Loyalty Programme:** Buy 9 coffees, get 10th free. Auto-enroll on name capture. Stamp tracking, free coffee balance, banker system.
- **Automated Backups:** Nightly database backup at 2am, 30-day retention.
- **QR Codes:** Loyalty QR and Order QR generated for print posters.
- **Handover Document:** 5-page guide for Daniel and staff covering login, daily workflow, and key rules.
- **Workspace Views:** Admin view (full tools) and Staff view (simple client mode) on same workspace. "Preview as Staff" toggle for admin testing.

3. What Went Well

- Core system setup was fast: WhatsApp connected, AI responding, and menu loaded within hours.
- The keyword automation + AI dual system works well: keywords handle common queries instantly with formatted text, AI handles natural language.
- Loyalty enrollment flow works smoothly: QR scan, name entry, enrolled immediately.
- Order parsing with AI is accurate: handles modifiers (oat milk, decaf), extras pricing, and customer notes.
- Workspace isolation is correct: Daniel's data is separate from test/demo workspaces.
- Admin/staff view split allows Meir to manage without affecting Daniel's simple interface.
- Automated backups provide data safety from day one.

4. Issues Encountered and How They Were Resolved

Twelve issues were identified and resolved during the installation process. Each is documented below with the problem, root cause, and resolution applied.

Issue 1: Bot not replying after initial setup

Problem: WhatsApp messages appeared in FlowDesk but bot did not respond.

Cause: AI auto-reply was disabled by default in new workspace.

Fix: Enabled AI auto-reply in settings. Immediate resolution.

Issue 2: 2FA block on Meta Business Suite

Problem: Could not generate new access token because Facebook blocked 2FA changes from unrecognized device.

Cause: Meir was logged into Daniel's Meta account from a new MacBook.

Fix: Used the existing System User token that was already working. No new token needed.

Lesson: Always generate the permanent System User token BEFORE leaving the client's device/location.

Issue 3: AI listing full menu instead of redirecting to keyword

Problem: When AI handled menu questions, it listed drinks grouped on one line with pipes instead of the clean formatted keyword response.

Cause: AI was answering menu questions directly instead of redirecting to the MENU keyword.

Fix: Added Rule 21 to AI prompt: "Do NOT list the full menu yourself. Instead say: Reply MENU to see our full menu with prices!"

Issue 4: Keyword threshold too restrictive

Problem: Phrases like "Pls send menu" (3 words) bypassed keyword automations and went to AI.

Cause: Keyword trigger threshold was set to messages of 2 words or fewer.

Fix: Widened threshold to 5 words. Now "Pls send menu", "Show me the menu", "Where are you?" all trigger keywords.

Issue 5: Menu keyword conflict between Welcome and Our Menu

Problem: Both Welcome Menu and Our Menu automations had "menu" as a trigger keyword. Welcome Menu won because it was created first.

Fix: Removed "menu" from Welcome Menu triggers. Now "menu" correctly routes to the full menu display.

Issue 6: Food questions triggering coffee menu

Problem: "Do u have any food" triggered the coffee menu because "food" was a keyword trigger for the menu automation.

Fix: Removed "food" from menu triggers and "food menu" from synonym map. Added AI Rule 25 for proper food response. Food questions now get: "WhatsApp ordering is currently only available for our coffee menu. For food options, please check with staff in-store or at the counter."

Issue 7: Menu message getting cut off

Problem: AI-generated menu hit the token limit and was truncated.

Cause: AI response max_tokens was set to 300, too low for full menu.

Fix: Increased to 600 tokens. Also ensured menu questions route to keyword automation (static text, no token limit).

Issue 8: Loyalty signup blocked by email step

Problem: Customers enrolled but were not added to loyalty until they provided email or typed SKIP.

Cause: Loyalty enrollment happened after the email step, not after the name step.

Fix: Moved enrollment to happen immediately after name capture. Email is now optional and non-blocking.

Issue 9: VAT being added on top of prices

Problem: Orders showed VAT line added to the total.

Cause: Default order processing included VAT calculation.

Fix: Removed VAT from order flow. All prices are VAT-inclusive as provided by the client.

Issue 10: Awkward "Reply MENU to go back" wording

Problem: Footer text on automations said "Reply MENU to go back" which does not make sense from a customer perspective.

Fix: Changed to "Reply 4 to place an order, or ask me anything else." across all automations. Removed footer entirely from "Speak to Someone" automation.

Issue 11: Coffee size confusion

Problem: Initially set up with Regular/Large options for Cappuccino, Flat White, Americano. Client later decided single size only.

Fix: Updated all three systems (AI settings, keyword automation, order parser) to single-size pricing. Added AI Rule 24 to handle size requests gracefully.

Issue 12: Poster QR code placement

Problem: Could not accurately place QR codes onto AI-generated poster PNGs from compressed images.

Cause: Working with WhatsApp-compressed versions of posters lost pixel precision.

Resolution: Provided standalone QR code images. Client used Manus AI to regenerate posters with QR placeholders, then QR was placed cleanly.

Lesson: For print materials, always work with original high-resolution files or have the client use a design tool (Canva, Manus) for precise placement.

5. What Still Needs Improvement

- **Admin Tools Panel:** A dedicated admin panel with AI settings editor, menu/database editor, business info editor, WhatsApp integration status, and backup/export tools. Currently settings are editable but the UI could be more user-friendly with clear section labels.
- **Business Verification:** Daniel's Meta Business account is not yet verified. This limits business-initiated conversations to 250/day. Should be completed with a bank statement or business registration document.
- **Manual Data Export:** A "Download Data" button for Daniel to export contacts, loyalty members, and conversation history on demand.
- **Campaign Templates:** Pre-built campaign templates specific to coffee shops (happy hour, loyalty milestone, new menu item, weekend specials).
- **Reporting Dashboard:** Enhanced daily/weekly reports showing order trends, popular items, loyalty programme growth, and revenue tracking.
- **Multi-branch Support:** Future installations may need branch-level separation within the same client workspace.

6. Key Lessons for Future Client Installations

Lesson 1: Generate the System User token during the on-site visit

The permanent token must be generated while you have physical access to the client's Meta account. Facebook may block 2FA changes from new devices later.

Lesson 2: Test the full flow before leaving

Send a test message, verify the bot replies, place a test order, complete a loyalty signup. Do not leave until all paths are confirmed working.

Lesson 3: Client decisions change during testing

Menu pricing, size options, loyalty rules, and wording all changed multiple times during live testing. Build the system to be editable from admin without code changes wherever possible.

Lesson 4: Keyword automations should be the primary response path

Static keyword responses are faster, perfectly formatted, and predictable. AI should handle natural language edge cases and redirect to keywords when appropriate.

Lesson 5: Test with real phrasing, not just exact keywords

Customers type things like "Pls send menu", "Do u have any food", "Where r u". The system must handle informal, abbreviated, and multi-word queries.

Lesson 6: WhatsApp message limits

WhatsApp has character limits and formatting constraints. Keep menu responses concise, use line breaks, avoid markdown. Split long content into sections if needed.

Lesson 7: Have print-ready QR codes prepared before the visit

Generate all QR codes (loyalty, ordering) before the installation visit. Provide high-res standalone images the client can drop into any design tool.

Lesson 8: Create the handover document during setup, not after

The staff training document should be ready before the installation is "complete". Staff need it immediately.

Lesson 9: Automated backups from day one

Set up nightly database backups before going live. Client data protection cannot wait.

Lesson 10: Clean separation between test and live workspaces

Rename old test/demo workspaces clearly. Never share triggers, automations, or settings between test and live workspaces.

7. Installation Timeline

June 10 - Morning	Meta Business Suite setup, WhatsApp number registration, token generation, payment method added.
June 10 - Midday	FlowDesk connected, AI enabled, first bot reply confirmed, workspace configured.
June 10 - Afternoon	Menu loaded, loyalty updated, handover document created, QR codes generated, poster QR placement.
June 10 - Evening	Loyalty signup flow fixed, VAT removed, menu display fixed.
June 11 - Morning	Menu formatting fixed, address display fixed, size rules updated, keyword matching widened.
June 11 - Midday	Food question routing fixed, footer wording updated, AI/keyword sync ensured.
June 12	Test orders cleaned up, installation report and guide created.

8. Current System Status

WhatsApp	LIVE and responding on +27 60 977 8723
AI Assistant	Active, 26 behavioral rules
Keyword Automations	7 active automations
Menu	25 drinks + 4 extras, single-size pricing
Loyalty	Buy 9 get 10th free, auto-enroll on name capture
Orders	Clean (test orders deleted)
Backups	Nightly at 2am, 30-day retention
Workspace	Admin and staff views working correctly
